Week 05 — The Job: Show Her the Page

100L · Semester 1 · Code Editor / IDE · Lab: 65 minutes within a 2-hour class

Your brief

> **Curriculum deliverable:** “Configure VS Code; first "Hello World" page opened live in the browser”.

> **Mama Titi** · 11:15 am
>
> Funmi says the total is correct now. Thank you o! But I don't understand code. Show me something I can see in a browser.

Set VS Code up the way a working developer would, add one feature from a file, and build a page you can watch change in your browser. Use the class workbook: "The job" explains the ideas and Appendix A–G has every click. This is 100L: no AI may write, complete or fix your work, and VS Code's AI features stay switched off.

Keep individual evidence. Swap driver and navigator halfway through each part. Both learners configure their own VS Code profile or take a turn on the shared station, and both explain results.

Part	Time	Evidence
1. Configure VS Code	15 min	Settings file screenshot
2. Install an extension offline	10 min	Installed extension screenshot
3. Hello World, live	20 min	Page in the browser, edit log, `index.html`
4. Search, format and debug drill	15 min	Counts, before/after, Watch table
5. Evidence check	5 min	Completed checklist
Total	**65 min**	

Start a log in your notebook with four columns. Keep **at least six meaningful entries** across Parts 1–4.

Log headings: What I changed · How (menu, shortcut or command) · What I expected · What happened.

Part 1 · Configure VS Code

Open **Settings** (**Ctrl+,** · ⌘,). Use its search box to find and set each of these:

Search for	Set it to	Why
`disable AI features`	ticked	100L work is unaided

Search for	Set it to	Why
`auto save`	`afterDelay`	Saves your work a moment after you stop typing
`format on save`	ticked	Tidies the file whenever **you** press **Ctrl+S** · **⌘S**
`font size`	a size the back row can read, at least `16`	Readable when projected
`word wrap`	`on`	Long lines fold instead of running off the screen

Then run **Preferences: Open User Settings (JSON)** from the Command Palette. Every setting you changed is written in this file. Screenshot it, and record one entry you did not expect.

✓ **What you should see:** a short file between `{` and `}`, with lines such as `"files.autoSave": "afterDelay",` and `"chat.disableAIFeatures": true,`. A theme you chose earlier may appear too.

> **Notice:** with Auto Save set to `afterDelay`, VS Code formats only when you save yourself. Pressing **Ctrl+S** · **⌘S** is still a good habit.

Part 2 · Install an extension offline

1. Use workbook Appendix E to install **Live Preview** from `live-preview.vsix` in your `edupoint-installers` folder. Use the Extensions view or the terminal route, not the online Marketplace search.
2. Open the Extensions view's **Installed** list. Screenshot **Live Preview** with its publisher, Microsoft.
3. In your log, write one sentence: what does this extension add that VS Code lacked?

If blocked for three minutes, record the exact message and ask for the prepared station. You can still finish Part 3 using the **No extension?** route in Appendix G.

Part 3 · Hello World, live

1. Use the integrated terminal to make a fresh folder named `edupoint-week05-lab` in your home folder. Then **File → Open Folder…** to open it. If the name already exists, agree a fresh name with the tutor.
2. Create `index.html` in the Explorer. Use **!** from the suggestion list to start the page, as in Appendix F.
3. Give it a title of your choice. Inside `<body>`, add a heading that says `Hello, World!` and one sentence of your own on the next line, written as `<p>…</p>`. No personal details are needed.
4. Open the page **in your browser**: Live Preview's address, or the `file:///` route if you have no extension. Screenshot the browser with its **address bar visible**.
5. Make **three** visible changes to your sentence or heading, one at a time. Before each, predict what the browser will show. Record each in your log, including whether you had to refresh.

Part 4 · Search, format and debug drill

Work in `edupoint-week05-kit`. If you replaced `Zobbo` in class, that is fine: this drill uses other words.

1. **Search.** Mama Titi is raising the price of zobo from **N300** to **N350** next week. Search the kit for `N300`. Record the count and the files **before** replacing. Replace them all, then search again and record what VS Code reports.
2. **Format.** In your own `index.html`, add extra spaces at the start of three lines so the page looks messy. Screenshot it. Press **Ctrl+S** · **⌘S** and screenshot again. Write which setting did the work.
3. **Debug.** In `count.js`, set a breakpoint on the line inside the `for` loop. Start debugging and add `total` to **Watch**. Fill in the table for **your file as it is now**: with the class fix, or without it if you skipped Beat 3. Stop debugging, run `node count.js` and record the output.

Pause	price	total	My note
1	_____	_____	_____
2	_____	_____	_____
3	_____	_____	_____

Output of `node count.js`: _____

Part 5 · Evidence check

Each learner checks their own evidence against the list below. Circle one feature you can demonstrate without your partner's help. Submission gets its own ten minutes after show & tell.

Show, explain, submit

Show & tell · 10 minutes after the lab. Two pairs show their page changing in the browser and explain one VS Code feature they used. The navigator answers one question.

Ship · final 10 minutes of class. Git workflows arrive in week 11. Use the submission destination the tutor announces. No pull request is required this week. Do not upload student work to this public teaching-materials repository. The tutor confirms the due date through the class channel.

Submit one evidence pack per learner

- Your log, with at least six meaningful entries.
- Screenshots: settings JSON, installed Live Preview, your page in the browser with the address bar visible, and the messy/tidied pair from Part 4.
- Your Part 4 counts, Watch table and `node count.js` output, written in the log or as a photo.
- Your `index.html` file itself.

Naming: use `week-05-<surname>-<firstname>-<n>.png` for screenshots or `.jpg` for photos, numbering from 1. Rename your page `week-05-<surname>-<firstname>-index.html` when you submit it, and keep the original in your lab folder. If combining evidence into one PDF, use `week-05-<surname>-<firstname>.pdf`. Keep private files, other students' details and unrelated windows out of every capture.

No internet: save the pack locally and give it to the tutor by USB or local transfer, or hand in the paper log for collection. The tutor records receipt; delayed connectivity must not erase your work.

Marking · 10 points

Criterion	Points	Evidence for full marks
Editor configuration	2	Settings JSON shows all five settings, including AI features disabled
Offline extension	2	Live Preview installed from the VSIX file, with an explanation of what it adds
Hello World page	3	Own `index.html` with title, heading and sentence; shown in a browser with its address; three predicted edits logged
Search, format and debug	2	Counts recorded before replacing; before/after formatting; a credible Watch table and output
Evidence and explanation	1	Clear, individually owned evidence and a credible explanation of the work
Total	**10**	

The weekly-submission category remains **10% of the semester**, not 10% per lab. Equipment or installation blockers are recorded for follow-up, not treated as a completed task or an automatic failure. Affected criteria stay pending until the learner demonstrates them on a suitable station.

Optional extras · after the core work, no extra marks

- Choose a different colour theme and explain why it suits a projector or a bright room.
- Find **Toggle Word Wrap** in the Command Palette and say which shortcut it shows.
- Use **Ctrl+P · ⌘P** to open three files without touching the Explorer.

For tutors

Run sheet · exactly 120 minutes

Elapsed time	Minutes	What to run
00:00–00:10	10	Cold open: read Mama Titi's message aloud; pairs add up the order and predict why Word broke the file; room vote
00:10–00:18	8	Beat 1: three kinds of tool; plain editor vs VS Code; open the kit folder, disable AI features, Format Document, auto-closing tag
00:18–00:26	8	Beat 2: room predicts the `rice` count, then searches; search `Zobbo`, read the preview, replace
00:26–00:35	9	Beat 3: integrated terminal, `node count.js`, breakpoint and Watch; the unsaved fix, then save
00:35–01:40	65	Lab Parts 1–5: 15 + 10 + 20 + 15 + 5 minutes
01:40–01:50	10	Two short demos; ask a non-driver to explain one feature
01:50–02:00	10	Each learner checks evidence, saves and submits; collect offline work

Each beat runs Problem → Idea → Try. Read the story problem aloud in under a minute, teach the idea with its diagram in two to three minutes, then stop talking: learners spend the rest of the beat trying. Name the myth out loud before the try; it is what learners will otherwise believe. Demonstrate one action, then stop while learners try it. Zoom VS Code (**Ctrl+=** · **⌘=**) so the back row can read the projected editor. Ask “What do you expect to see?” before each reveal.

Prepare before students arrive

- Read the 100L S1 story bible, `curriculum/100L-S1/story.md`, so the characters and the cliffhanger stay consistent with later weeks.
- Print the pre-read, workbook and lab; save PDFs and image assets locally. No web access is needed during the core lesson.
- Copy the repository's `practice-kit` folder to every machine as `edupoint-week05-kit` in the home folder. Keep a clean copy on USB: Beat 2 changes the menu files, so re-copy for a learner who needs a reset.
- Add `live-preview.vsix` to each `edupoint-installers` folder. Download it once on a connected machine: in VS Code's Extensions view, search **Live Preview** by Microsoft, right-click it and choose **Download VSIX**. Record the version in the kit manifest; these notes were tested with 0.4.20.
- Keep offline VS Code and Node.js installers from week 4 for anyone still missing them. Confirm each station's VS Code opens a folder and runs `node count.js` in the integrated terminal.
- Preflight one Windows machine in both PowerShell and CMD, and one macOS or Linux machine, with networking disconnected. On macOS, check whether function keys need **fn**.
- Check that the class submission destination works, and announce the deadline through the normal class channel. No new deadline or assessment weight is introduced by these notes.

Protect practice time

Cap an individual installation blockage at three minutes: record it, move the learner to a prepared station and arrange follow-up. A learner without Live Preview completes Part 3 with the `file:///` route. Check for AI features at the start of the lab, not after: Chat panels, inline suggestions or sign-in prompts mean the setting is off. Disable or avoid AI assistance during assessed work.

Ungraded answer keys

These cover the workbook's guided checks only.

- Cold open: the order should total **₦2,500**. Word saves its own format and curly quotes, not plain text.
- Beat 2: `rice` finds **8 results in 3 files** (`count.js` 5 from "price" and "prices", `monday.txt` 2, `messy.html` 1). With **Match Whole Word** it finds **3 results in 2 files**. `Zobbo` finds **5 results in 3 files**: `monday.txt` 2, `tuesday.txt` 1, `wednesday.txt` 2.
- Beat 3: the paused values are 1500/0, 700/1500 and 300/700. With `total = total + price;` unsaved, `node count.js` still prints `Order total: N300`; after saving it prints `Order total: N2500`.

There is no public worked solution for the graded lab. Keep any marking key in the tutors' private materials. Do not replace an individual's demonstration with their partner's result.

Prompts for feedback

- “Which setting made that file tidy itself, and when does it run?”
- “How many matches did you expect before you pressed Replace All?”
- “What did the breakpoint show you that the printed total did not?”
- “Your fix is on screen but the output hasn't changed. What are your two suspects?”
- “What address is your browser showing, and what does `127.0.0.1` mean?”

Completion and follow-up

Keep the full class to **120 minutes**: 10 warm-up + 25 guided practice + this 65-minute lab + 10 show & tell + 10 Ship. Record equipment or installation blockers and arrange an individual catch-up. Do not silently add a mandatory second class block. Announce the actual submission deadline; these materials intentionally do not invent one.
